

IT Relocation

What happens to your IT network when your company moves? Launch 3's organized IT relocation creates noticeable results for successful setup and functionality. We handle IT relocation of servers, PC/computers, offices, and data centers and are a dependable source for migrating valuable IT equipment and data for custom requirements. With a background in server, storage and communication equipment from all major manufacturers, our team is trained in all methods and safety procedures for single to multiple rack transfer.

Decommission

Launch 3 delivers a controlled system shutdown that addresses the entire IT infrastructure such as servers, switches, storage, routers, UPS, backup libraries, firewalls, and workstations. We remove servers and rails from their racks and disconnect all cable prior to transport.

Transportation

We deliver secure transport of IT equipment to ensure no damage occurs during physical transport. An inventory of all stock takes place before, during, and after transportation.

Office Migration

We can assist in the relocation and deployment of desktop, telephone, printers, PC equipment, hardware refresh, software upgrade, and VOIP rollout.

Installation

At the new site, technicians will reassemble rack units. Full installation ensures organized set-up and proper data cabling lengths. Other tasks include facilities layout, line drops, server room configuration, power, HVAC requirements, infrastructure hosting, testing, worker access, security, VOIP planning, and unified messaging integration.

Disposal

We deliver disposal of parts that are no longer usable. We comply with the procedures set forth by the WEEE Directive. Launch 3 helps to reduce energy usage, reuse components, and recycle materials.
